Adaptive Robust H Infinity Control

The adaptive controller consists of an H_∞ suboptimal control law and a robust parameter estimator. Stability and robustness analysis is based on a general frozen time analysis framework. Global boundedness of the adaptive control system in the presence of parametric uncertainty, unmodeled dynamics, and bounded noises is proved.

This paper proposes a robust H-infinity control design of a single unit differential type Wheeled Mobile Robot. Mobile robots are non holonomic systems as their constraint equations are not integrable. Considering the constraints and combining the kinematics and dynamics of the system, a linearized model is obtained.

Robust H-infinity (H_∞) Stabilization of Uncertain ...

H_∞ (i.e. " H-infinity ") methods are used in control theory to synthesize controllers to achieve stabilization with guaranteed performance. To use H_∞ methods, a control designer expresses the control problem as a mathematical optimization problem and then finds the controller that solves this optimization.

This example shows how to use Robust Control Toolbox™ to design a robust controller for an active suspension system. The example describes the quarter-car suspension model. Then, it computes an H_∞ controller for the nominal system using the hinfsyn command.

Robust Control of an Active Suspension - MATLAB & Simulink

The adaptive H-infinity filter is more robust because of the robust estimation method, based on the control of dynamic model errors and uncertain interference. In all presented cases, RMSEs of the AHF algorithm are the smallest for all coordinates, which means that the positions calculated by the AHF algorithm are in good agreement with the actual positions.

H_2 and H_∞ - Hankel norms are used to measure control system properties. A norm is an abstraction of the concept of length. Both of these techniques are frequency domain techniques. H_2 control seeks to bound the power gain of the system while H_∞ control seeks to bound the energy gain of the system. Gains in power or energy in the system indicate operation of the system near a pole in the transfer function.
