An internal combustion engine (ICE) is a heat engine in which the combustion of a fuel occurs with an oxidizer (usually air) in a combustion chamber that is an integral part of the working fluid flow circuit. In an internal combustion engine, the expansion of the high-temperature and high-pressure gases produced by combustion applies direct force to some component of the engine.

In internal combustion engines, exhaust gas recirculation (EGR) is a nitrogen oxide (NO<sub>x</sub>) emissions reduction technique used in petrol/gasoline and diesel engines. EGR works by recirculating a portion of an engine's exhaust gas back to the engine cylinders. This dilutes the O<sub>2</sub> in the incoming air stream and provides gases inert to combustion to act as absorbents of combustion heat to reduce
